

ABSTRACT

A sub system (110) included in a robot that executes a program for performing a predetermined function includes
5 a data receiving unit (115) that receives expansion data that expands the function of the robot, a data incorporation unit (116) that incorporates the received expansion data, a password output unit (113) that outputs a password corresponding to a predetermined condition, and
10 a server sub system (100) that provides a plurality of expansion data includes a terminal communication unit (101) that accepts an input of the password by a user, an option presentation unit (125) that obtains the plurality of expansion data corresponding to the accepted password
15 and presents to the user, a data selection unit (104) that accepts a selection of the user, and a data transmission unit (106) that transmits the selected expansion data to the robot sub system (110).
